sites versus branches

You can determine omega for the whole dataset; however, usually not all sites in a sequence are under selection all the time.

PAML (and other programs) allow to either determine omega for each site over the whole tree, *Branch Models*, or determine omega for each branch for the whole sequence, *Site Models*.

It would be great to do both, i.e., conclude codon 176 in the vacuolar ATPases was under positive selection during the evolution of modern humans – alas, a single site does not provide much statistics

ML Ratio test

In case of two nested models that differ by n parameters, one can test if the increase in likelihood (=probability of the data) is significant, i.e., more than expected from having an additional parameter.

E.g., phylogenetic tree with and without clock. In this case, the model without clock is the more complex model, that has n-1 more parameters (the branch lengths leading to the leaves) than the clock model.

Using the atp_all.phy example from tree-puzzle

ML Ratio test

atp_all.phy example from tree-puzzle

go through outfile_atp_all_puzzle_clock.out (at http://cogarten.uconn.edu/mcb5472_2014/outfile_atp_all_puzzle_clock.out)

```
MOLECULAR CLOCK LIKELIHOOD RATIO TEST FOR USER TREE # 1
log L without clock: -35429.62 (independent branch parameters: 80)
log L with clock: -35558.78 (independent branch parameters: 45)

Likelihood ratio test statistic delta: 442.33
Degrees of freedom of chi-square distribution: 44
Critical significance level: 0.000

The simpler (clocklike) tree is rejected on a significance level of 5%. The log likelihood of the more complex (no clock) tree is significantly increased.

Please take care that the correct root is used!
```

ML Ratio test

codeml example hv1.phy

Control file

```
model = 0 * 0:none, 1:b, 2:2 or more dN/dS ratios for branches
Nstites = 0 1 2 * 0:none w:1:neutral;2:selection; 3:discrete;4:freqs;
* 5:gamma;15:gamma;7:beta;10:beta;6:beta;2:beta;gamma;
* 16:beta;sgmmw;1; 11:beta;normal;1; 12:beta;normal;1;
* 13:normal;0
```

Output file:

http://cogarten.uconn.edu/mcb5472_2014/hv1_sites.codeml.out

ML Ratio test

codeml example hv1.phy

output file

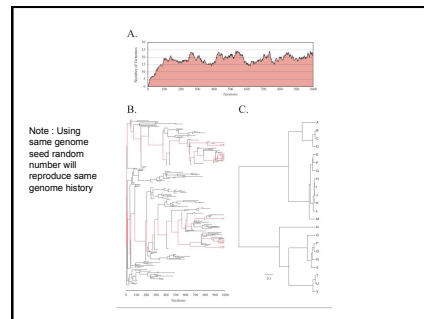

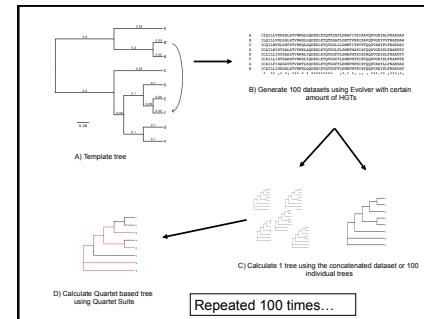

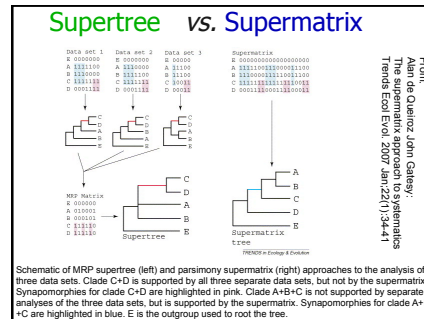

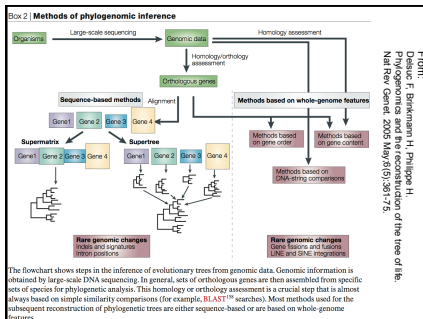

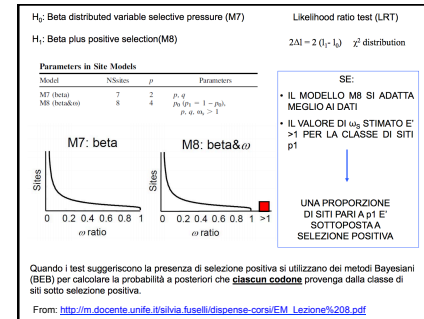

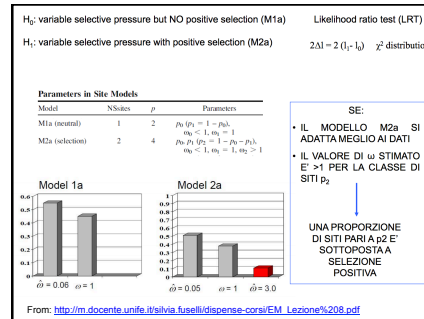

```
Model #: one-ratio
TREE # 1: (((((((((25, (27, ((28, 18), 13)), 21), (((24, 19), 20), 2)
lnL(nlmax): 57.786281 -157.27859
lnL(nlmin): 57.786281 -157.27859

Edmond J. Safra Bioinformatics Program,
Fulbright Fellowship,
NASA Exobiology Program,
NSF Assembling the Tree of Life Program and
NASA Applied Information Systems Research Program

Why do we need gene families?

Which genes are common between different species?

Which genes were duplicated in which species?
(Lineage specific gene family expansions)

Do all the common genes share a common history?
Reconstruct (parts of) the tree/net of life /
Detect horizontally transferred genes.

Why do we need gene families?

Help in genome annotation.

A) Genes in a family should have same annotation across species (usually).

B) Genes present in almost all genomes of a group of closely related organisms, but absent in one or two members, might represent genome annotation artifacts.

Selection of Orthologous Gene Families

All automated methods for assembling sets of orthologous genes are based on sequence similarities.

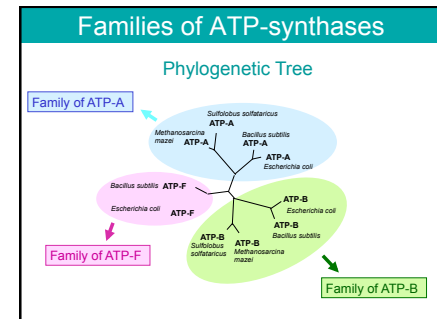

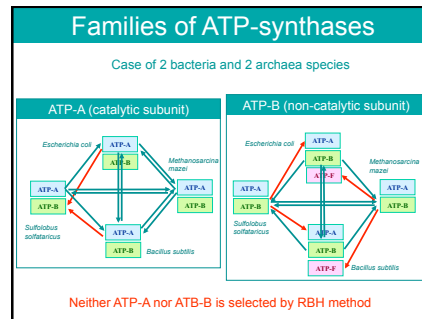

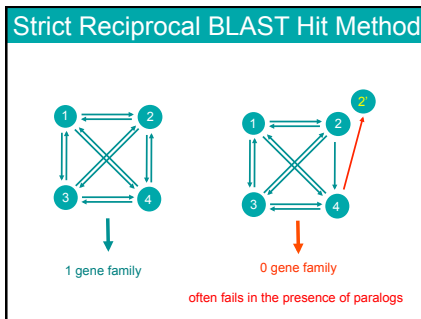

BLAST hits

Triangular circular BLAST significant hits
(COG, or Cluster of Orthologous Groups)

Sequence identity of 30% and greater
(SCOP database)

Similarity complemented by HMM-profile analysis
Pfam database

Reciprocal BLAST hit method

clusters/clusters_NNN.out.names

- Are all the annotation lines uniform?
- Within this report, if there are inparalogs, one is listed as a family member, the other one as inparalog. This is an arbitrary choice, both inparalogs from the same genome should be considered as being part of the family.
- Out of cluster paralogs are paralogs that did not make it into a cluster with "many" genomes.

```

The Quartet Decomposition Server

<http://csb1.bmb.uga.edu/QD/phytree.php>

Input A):
a file listing the names of genomes: E.g.:

The Quartet Decomposition Server

<http://csb1.bmb.uga.edu/QD/phytree.php>

Input B):
An Archive of files where every file contains all the trees that resulted from a bootstrap analysis of one gene family:

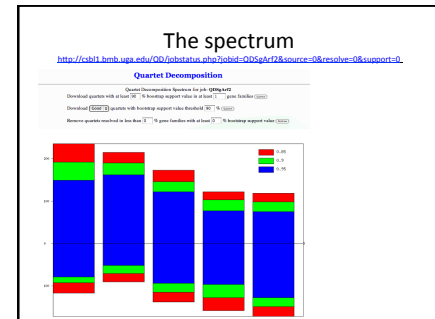

The Quartet Decomposition Server

<http://csb1.bmb.uga.edu/QD/phytree.php>

Trees from the bootstrap samples should contain branch lengths, but the name for each sequence should be translated to the genome name, using the names in the genome list.
See the following three trees in Newick notation for an example:

```

(((Tnea:0.1559823230,Tpet:0.0072068797):0.0287486818,Tmar:0.0046676053):0.0407339037,Tnap:0.0000000001,TRQ2:0.0000000001);
